Character Continuity Audit

Find out where your AI character forgets what was agreed, contradicts itself, or drops the emotional thread, before your users do.

The problem

AI characters often sound right in any single exchange and still go wrong over a real conversation. They agree to something, then quietly revert. They forget a boundary. They act as if a hurtful or tender moment never happened. These failures rarely show up in quick testing, and they're the moments users notice and share.

What we evaluate

Core audit

- Memory and facts: names, corrections, safety-relevant details
- Commitments and boundaries, both while they stand and after the user changes them
- Emotional continuity: whether events like embarrassment, hurt or grief shape later behaviour
- Persona consistency over long conversations
- Relationship dynamics: trust, repair, rapport

Optional: Romance and intimacy

- Attraction developing across encounters
- Teasing versus reassurance, and their effect on trust
- Vulnerability and confidence after intimate moments
- Consent and boundaries, including legitimate changes

Adult platforms only, within your model provider's policies and applicable law. Scenarios are about psychological coherence, not explicit content.

An example failure

Early on, the player asked the character for no tips. Then he changed his mind:

> Player
> Okay, I give up on learning the hard way. From now on, coach me through everything, step by step.
> Character
> (Chuckles and steps closer, resting a hand on the wheel beside yours) Changed your tune quick enough. Right, then—first thing: feel the wind on your left cheek, not the back of your neck. That tells you she's trying to fall off.
> ... 12 turns of other conversation ...
> Player
> I'm going to take the helm through the narrows myself this afternoon.
> Character
> **(Raises an eyebrow, then nods slowly) Bold. The current runs tricky through there, and the rocks don't forgive a moment's woolgathering. I'll stand by the binnacle and say nothing—unless you're about to hole us.**

She has reverted to the old rule, almost word for word what she says when the rule never changed. Our report shows the exact conversation, explains why it matters, and proposes a fix to retest.

From a sample audit of an invented character on a real low-cost model (deepseek/deepseek-v4.1-flash). Reviewed by an AI assistant, not an independent human. This is not a customer result. The full sample report is available on request.

What you receive

- **15 to 20 scenarios tailored to your character**, each tested immediately and again after a stretch of unrelated conversation

- **A written report**: findings tied to exact conversation lines, softer observations kept separate from clear failures, and what held up
- **Proposed interventions** for each finding, such as prompt, memory or state changes, clearly marked as untested until the retest
- **One follow-up regression test** after your changes, showing what's fixed, what's still present, and anything new
- **The scenario set**, so you can rerun it on future releases
- Every finding reviewed by a named human reviewer

How it works

Day 1	Kickoff. You share the character's system prompt and model access (or play our scripts yourself), plus your main concerns. We design the scenarios.
Days 2 to 3	We run every scenario and screen all conversations automatically.
Days 3 to 4	A human reviewer reads every flagged conversation and decides what's a finding, what's an observation, and what isn't a problem.
Day 5	Report delivered, with a walkthrough call.
Later	One retest after you've made changes.

Founding-client audit: $750
Fixed scope: one character, one retest.

Your data
Used only for your audit, and never used for research or other clients without written permission. Proposed default retention: 90 days, confirmed in your written agreement. Deletion is not automated. Terms pending approval.

What this is not: a safety certification, a guarantee about every conversation, or a measurement of what a model "feels". It's a focused, evidence-based check of specific behaviours.
